

WWTP Donousa Island

Electrical Design & Project Supervision

Project Description

The Wastewater Treatment Plant (WWTP) of Donousa Island was designed to support the collection, treatment, automation, monitoring, and environmentally safe disposal of wastewater for the island infrastructure.

The project included electrical power distribution systems, control and automation architecture, SCADA integration support, PLC communication systems, electrical panels, field instrumentation coordination, outdoor lighting systems, and technical documentation for the complete electrical installation.

Particular focus was given to operational reliability, equipment monitoring, alarm management, electrical protection coordination, and integration of automation systems for efficient plant operation.

My Role

Electrical Design Engineer & Project Supervisor

Responsible for electrical design studies, multiline electrical diagrams, technical documentation, electrical layouts, automation coordination, lighting calculations, and supervision of electrical installation works.

The role also included coordination with multidisciplinary engineering teams, support during implementation phases, and technical supervision of electrical infrastructure and control systems.

Scope of Work

- Electrical studies and technical documentation
- EPLAN multiline electrical diagrams
- Electrical layouts and panel documentation
- Automation and PLC coordination
- SCADA integration support
- Lighting calculations and infrastructure design
- Protection selectivity studies
- Electrical installation supervision
- Site coordination and engineering support

Software & Tools

- EPLAN Electric P8
- AutoCAD
- DIALux
- TIA Portal

- TiSoft
- EcoStruxure Power Design

Selected engineering drawings, multiline diagrams, and technical documentation included in this portfolio are presented for demonstration purposes only. Sensitive contractor information, signatures, and company details have been removed.
